

Swivel arm for pipes connection on Semitrailers

Another interesting element is now available in the already wide range of hydraulic components (gear and piston pumps, oil tanks and tipping valves) dedicated to truck/trailer applications.

It is a swivel arm, mounted on the rear of the tractor unit, that allows it to follow the movements of the semitrailer.

Its steel structure is specially treated and painted in order to guarantee a long lasting resistance against corrosion.

The kit includes the steel swivel arm, the protection cover and the necessary parts for the proper installation.

This is the ordering code: **122.015.00200.**
